- \$a Armenian \$d Indo-European \$e SW USSR (Armenian SSR) \$f 4 million \$g Merritt Ruhlen \$g Marilyn Vihman (review)
- \$\frac{1}{245}\$\$ \$a Allen, W. S. \$b 1950 \$c "Notes on the phonetics of an Eastern Armenian speaker" \$d Transactions of the Philological Society, 180-206 \$g Oxford: Blackwell \$q 1 informant \$r 12 sessions with native speaker
- \$\text{245} \quad \text{\$\text{LONG CONSONANTS \$A "Geminated consonants are rare, and are largely to be accounted for by morphological junctions." (p.188) Examples are given for long /t/, /r-fricative-retroflex/, /r-approximant-uvular/, /n/, and /l/.
- \$\frac{\\$50\text{NON-DISTINCTIVE}}{\\$4\text{Vowels in stressed syllables are generally longer than those in unstressed syllables. "Armenian does not make distinctive use of vowel-length, which is subject to considerable variation." (p.183)
- \$\text{9a MASALIZED YOHELS \$A "Yowels in contact with nasals are subject to varying degrees of nasalization, and in rapid utterance the words [written] 'em' '(I) am' and 'en' '(they) are' were both realized as [e-nasalized]."

VOLUME 1 -- SEGMENT INVENTORIES, GENERAL COMMENTS, FOOTNOTES

Armenian

- \$\$ RETROFLEXED VOWELS (NON-DISTINCTIVE) \$\$A A vowel is retroflexed when followed by a long or word final /r-fricative-retroflex/, or when a following /r-fricative-retroflex/ is part of a stressed syllable.
- \$a STRESS \$A "Word stress is generally on the last syllable whose nucleus is other than /schwa/.... In words of more than three syllables there is a secondary stress on the initial syllable." (p.183)
- \$4 "The tenseness and aspiration of [the weakly aspirated] stops is markedly less than that of the fully aspirated stops and affricates. ... At the reduced speed of utterance the light aspiration did not occur medially." (p.203)
- 245 03 \$A "Aspiration is strong in all positions" for the aspirated stops and affricates, which are markedly tenser than the unaspirated plain stop series. (p.188)
- \$\text{9.5}\$ \text{ \text{\$^{\text{05}}\$ of the ejective series, the glottal plosion is never very strong, and is weakest at the commencement of a medial unstressed syllable; in some such cases it might in fact be more accurate to speak of it as potentially rather than actually present, being audibly realized only in careful utterance. At the commencement of initial and stressed syllables, however, glottalization is clearly present, and is particularly marked (though not violent) in final position." (p.188)
- \$4 "In the palatoalevolar class all articulations were accompanied by marked lip-protrusion, tending to produce a low-frequency acoustic effect in the fricatives and the fricative element of the affricates." (p.188)
- \$4 /x-uvular/ varies "from velar to post-velar according to following vowel; in final and preconsonantal position post-velar." (p.195) It is "generally accompanied by considerable scrape." (p.195)
- 245 09 \$A "Retroflexion and friction are most marked when [/r-fricative-retroflex/] is (1) final, (2) geminated, (3) in a stressed syllable." (p.195)
- 245 10 \$A /r-approximant-uvular/ varies "from uvular to pre-uvular." It is "generally articulated without scrape." (p.196)
- 245 12 \$A In at least one word [r-approximant-uvular-voiceless] was distinguished from /x-uvular/principally by its lack of scrape. (p.196)
- 245 13 \$A /r-trill/ is "strongly rolled." (p.197)
- 245 14 \$A /r-trill/ has "velar resonance." (p.193)
- 245 15 \$A The voicing of /h/ "varied in the same word from utterance to utterance." (p.196)
- 245 16 \$A /yod/e-mid/ has "slight front raising," as distinguished from the greater muscular tension and constriction of /yod/. (p.190)
- 245 30 \$A /f/ "occurs only in foreign loans and proper-names." (p.194)
- \$4 "/schwa/...is never fully stressed or lengthened. ...In medial position it is in all cases to be treated as 'anaptyctic' and related to the composition of permitted consonant groups. Its non-phonematic nature is signalized by its omission in the Armenian spelling.... In some cases its use appears to be optional." (p.185)
- 245 32 \$A Front vowels have a centering off-glide /schwa-glide/ before /r-approximant-uvular/.
- 245 60 \$A The unaspirated stops and affricates are voiced when preceded by a masal.
- \$4 The unaspirated stops and affricates are voiced with voiceless release in final position after a vowel. (There may also be some voicing intervocalically.) (p.200)
- \$4 The unaspirated stops and affricates are lightly aspirated in word final position after /r-fricative-retroflex/.
- 245 <sup>63</sup> \$A In rapid speech /v/ in intervocalic position is sometimes realized as a semivocalic glide [w].
- 245 <sup>64</sup> \$A After masals and /r-fricative-retroflex/ the unaspirated affricates are liable to lose their stop element in rapid speech.
- 245 65 \$A /n/ is realized as [eng] before a palatoalveolar or velar consonant.

- 245 66 \$A /l/ is velarized word-finally.
- 245 67 \$A Between consonants the sequence /schwa.l/ is sometimes reduced to [l-syllabic].
- 245 <sup>68</sup> \$A /r-fricative-retroflex/ is realized as an approximant word-initially and before an unstressed youel.
- $^{69}$  \$A /r-fricative-retroflex/ is generally devoiced after /t-aspirated/, or before a voiceless stop or affricate.
- 245 70 \$A /r-fricative-retroflex/ may be partly devoiced word-finally.
- 245 71 \$A /r-fricative-retroflex/ is often realized as Ir-flapl intervocalically in fast speech.
- 245 72 \$A /r-approximant-uvular/ is generally devoiced before a voiceless stop or affricate.
- 245 73 \$A /h/ is generally voiced intervocalically.
- 245 74 \$A /yod/e-mid/ loses its on-glide when it follows a palatoalveolar or precedes or follows /r-approximant-uvular/ (and in some cases, /r-trill/), except after velars.
- 245 75 \$A /yod/e-mid/ is realized as Iyod/epsilon1 before "-n."
- 245 76 \$A /schwa/ is raised and fronted in contact with palatoalveolar affricates and fricatives.
- 245 77 \$A /schwa/ is lowered and backed in word initial position before masals.
- 245 <sup>78</sup> \$A /a/ is backed in the vicinity of velar and uvular consonants.
- 245 <sup>79</sup> \$A /u/ is fronted in immediate contact with a front vowel or /yod/.
- 245 80 \$A /o-mid/ is realized as [o] in the vicinity of the palatoalveolar affricates.
